Dr Devipriya Arumugam, Assistant Editor
Scientific Reports

Dear Dr Arumugam,

Thank you for handling our manuscript, “A decentralized neutrosophic decision layer for global-state freshness in microservices architectures” (Submission ID c5ae1f20-9e89-4562-b69d-5dade5aca9d7), and for the guidance on the Data Availability declaration. We have made the requested change and respond point by point below. No scientific content was altered.

Editor comment. The Data Availability statement must comply with the journal’s policy (the phrasing “available from the corresponding author on reasonable request” and release “upon acceptance” is not acceptable), and the Data Availability declaration in the submission system must be set accordingly and match the manuscript.

Author response. We have revised the Data Availability (and, for consistency, the Code Availability) statement to remove “on reasonable request” and the deferral to acceptance:

- The aggregated result summaries that underlie every figure and table are now provided with the article as **Supplementary Information** (file **Supplementary_Data_1.zip**), so the data behind every figure are available to the editors and reviewers through the submission system and are published with the article.
- The complete raw per-trial outputs and the full implementation are archived together in a **Zenodo** record with a citable DOI, **10.5281/zenodo.20932989**. To protect ongoing work the record is under restricted access during peer review; the editors and reviewers can access it *immediately* through the private link below, and the record will be released openly upon publication (data under CC BY 4.0, code under the MIT licence).
- We have set the Data Availability declaration in the submission system to “**Yes**” and entered there the statement identical to the one now in the manuscript.

Reviewer / editor access link (restricted Zenodo record):

[Paste the Zenodo private/secret link here before uploading.]

Revised Data Availability statement (identical in the manuscript and the submission system):

The aggregated result summaries underlying every figure and table in this article—the per-configuration outcome summaries, the pairwise statistical comparisons, and the multi-seed replication checks—are provided with this article as Supplementary Information. All results are generated by the evaluation simulator under a fixed, content-hashed calibration and the recorded random seeds described in the Methods; together with the figure and table generators they regenerate every reported number. The complete raw per-trial outputs, together with the implementation, are archived in a single Zenodo record (DOI: 10.5281/zenodo.20932989).

During peer review this record is held under restricted access to protect ongoing work; editors and reviewers are granted immediate access through a private repository link provided to the editorial office, and it will be released openly upon publication (data under the Creative Commons Attribution 4.0 International licence, code under the MIT licence).

We believe this fully addresses the comment. Thank you again for your time.

Sincerely,

Haitham A. El-Ghareeb
